New polypeptides for promoting growth of neurons - useful for treatment of neurodegeneration, neuroblastoma and as additives for neuronal cell WPI; 1999-132166/11.

Claim 6; Page 14; 29pp; French.

cultures.

The present sequence represents a peptide that stimulates neuronal (particularly axonal) sprouting in neurons of the cerebral cortex, and in spinal cord cells inhibits aggregation and defasiculation of neurites while increasing formation of synaptic contacts. The peptide is used to regenerate nervous system cells, particularly for treating neurodegeneration (e.g. Alzheimer's or Parkinson's diseases, multiple sclerosis and myopathy), other conditions requiring regeneration (particularly elongation and synapse formation) or neuroblastoma. The peptide can also be used as an additive for neuronal cell cultures

```
This invention relates to novel genes and the encoded proteins thereof
that are derived from the sea squirt Ciona intestinalis. Specifically, it
refers to those genes that are expressed in the tissues or organs of the
sea squirt during its developmental phase. The present invention
describes the identification of these genes as useful for elucidation of
the mechanism of development and hence for developing regeneration
the mechanism of development and hence for developing regeneration
the research of various genetic diseases, as well as the analysis of cell
the research of various genetic diseases, as well as the analysis of cell
compositions can be useful for environmental measurements and water
surveys, particularly for sea water surveys, and also for the preparation
of transformed sea squirt for improving edibility of sea squirt such as
Halocynthia roretzi. This polypeptide sequence is a sea squirt protein
sequence that has tissue specific expression during development, given in
                                       ö
                                                                                                                                                                                                                                                                                                                  Sea squirt protein with tissue specific expression in development Seq304.
                                                                                                                                                                                                                                                                                                                                                       sea squirt; regeneration medicine; gene therapy; cell proliferation;
differentiation; reproduction; environmental measurement; water survey.

Jeb is required for visceral mesoderm migration and edifferentiation. Jeb is expressed in neurons in late embryogenesis indicating that it may play a role in the development of the nervous system. The jeb protein contains a LDL (low density lipoprotein) receptor repeat. The polymucleotide sequence encoding jeb is useful for preparing a composition for treating hyperproliferative disorders such as atherosclerosis. The present sequence represents human jeb protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; NOVX; atherosclerosis; hypertension; obesity; cancer; cytostatic;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed considerable (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is cuspilement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful for treating disorders (I) polypeptide and polymucleotide sequences have applications in casponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and can appear and the printed specification, but was obtained in calestronic format directly from WHDO at the wipe of the printed specification, but was obtained in the wip int, pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                              This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic growth or differentiation of blood endothelial cells with a candothelial cells (LEC) comprises contacting endothelial cells with a composition comprising an agent that differentially modulates blood or composition comprises. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at correlates with lymphoedema in human subjects, and with the proviso that correlates with lymphoedema in human subjects, and with the proviso that correlates with lymphoedema in human subjects, and with the proviso that correspond a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polymucleotides. The invention may be useful in comprising a lymphatic growth agent elected from VEGF-C or vasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells, in treating hereditary predisposition to the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the differential modulation of blood vessel endothelial cells growth agent may also be used in manifacturing a meticament of hereditary lymphoedema resulting from a mutation in a the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as LEC gene or of other diseases involving the lymphatic vessels, such as LEC gene or of other diseases involving the lymphatic vessels, such as LEC gene or of other diseases and cancer metastasis via the lymphatic system. The present sequence is that of a human LEC/BEC differential or any also be expressed protectin which is related to the method of the involving hypatics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.

biodiversity.

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) capenose. (I) is useful as hybridisation probes, polymerase chain sequences. (I) is useful as hybridisation probes, polymerase chain recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conditions useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (I) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The involving and polymucleotide sequences have applications in diagnostics, for genefic disorders or other trails to assess biodiversity responsible for genefic disorders or other trails to assess biodiversity amino acid sequences of the invention. Note: The sequence data for this amino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at certical control format directly from WIPO at

Human heat mitochondrial protein as a therapeutic target SeqID1094

06-MAY-2004 (first entry)

mitochondrial; human; screening assay; diabetes mellitus;

```
This invention relates to murine and human ADAWTS-N (A disintegrin-like and metalloprotease domain with thrombospondin type I motifs) proteins, designated ADAWTS-5, 6, 7, 8, 9, 10 and R1. Also included in the invention are cDNA sequences encoding the proteins, and antibodies specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in arthritic (both inflammatory) disease.

Cangiogenesis, tumour growth and metastases, and they may also be used for controlling embryogenesis and implantation of fertilised eggs. The present sequence represents human ADAMTS-7. The human ADAMTS-7 gene is
                                                                                                                                                     ADAMTS-N; disintegrin; metalloprotease; thrombospondin type I motif; tumour cachexia; inflammation; dermatosparaxis; BDS-VIC; angiogenesis; Ehlers-Danlos syndrome type VIIC; articular cartilage erosion; human; metastasis; embryogenesis; egg implantation; chromosome 15; ADAMTS-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Murine and human 'A Disintegrin-like And Metalloprotease domain with ThromboSpondin type I motifs' proteins and the nucleic acids encoding them, useful for treating e.g. tumors, inflammation and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 65; DB 4; Length 997; Pred. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), mycolonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic,

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

Novel isolated human extracellular matrix and cell adhesion molecules useful for treating, preventing connective tissue disorder e.g. osteoporogis, Paget's disease, genetic disorder e.g. cystic fibrosis, thalassemia

Claim 1; SEQ ID NO 23; 270pp; English.

ö

The invention relates to a novel isolated human extracellular matrix and cell adhesion molecule (referred to as ECMCAD 1-36), its biologically cell adhesion molecule (referred to as ECMCAD 1-36), its biologically cell active or immunogenic fragment or a sequence comprising 90 % identity to ECMCAD 1-36. The molecule is useful for screening a compound for ECMCAD 1-36. The molecule is useful in the diagnosis, treatment and conding nucleic acid are useful in the diagnosis, treatment and correvention of genetic disorder such as adrenoleukodystrophy, Down's prevention of genetic disorder such as adrenoleukodystrophy, bown's cell anemia, thalassemia, Wilms' tumor, etc, immunological disorders such as acquired immunodeficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anemia, asthma, atherosclerosis, autoimmune cell syndrome, allergies, anemia, asthma, atherosclerosis, autoimmune contact dermatitis, goodpasture's syndrome, gout, emolytic anemia, contact dermatitis, osteoporosis, psoriasis, rheumatoid cravitis, etc., a neurological disorder such as epilepsy, stroke, uveitis, etc., a neurological disorder such as epilepsy, stroke, uveitis, etc., a neurological disorder such as epilepsy, stroke, alsordersis, bacterial and viral meningitis, periodic paralysis, mental disorders including mood, anxiety, and schizophrenic disorders, amnesia, diabetic neuropathy, etc, connective tissue disorder such as disease, osteonecrosis, osteomyelitis, osteomyelitis, osteomyelicis, osteomyelicis, osteomyelicis, architis, systemic sclerosis, etc, and a cell proliferative disorder such as actinic keratosis, atherosclerosis, hepatitis, psoriatis, and actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers

The present invention relates to an isolated 27875, 22025, 27420, 17906, 16319, 55092, or 10218 nucleic acid molecule. The invention is useful for diagnosing or treating cancer or aberrant cellular proliferation and/or differentiation, immune disorders, heart disorders, cardiovascular disorders including endothelial cell disorders, haematopoietic disorders, blood vessel disorders, brain disorders, pain and metabolic disorders, liver disorders and platelet disorders. The invention is also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated 27875, 22025, 27420, 17906, 16319, 55092, or 10218 nucleic acid molecules, useful for diagnosing or treating cancer, pain, or immune, endothelial cell, hematopoietic, blood vessel, brain, metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene therapy. The present sequence is human ADAM-TS protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 1686;

Its abundance decreases from E10 to birth.
-1- SIMILARITY: Balongs to the semaphorin family.
-1- SIMILARITY: Contains 1 Sema domain.
-1- SIMILARITY: Contains 7 TSP type-1 domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6/ptodata/2/pubpaa/USO9B PUBCOMB.ppp:

Sequence 7, Application US/09369364A

Patent No. 6391610

GENERAL INFORMATION:
APPLICANT: Apte, Suneel
APPLICANT: Hurskainen, Tiina L.
APPLICANT: Hirohata, Satoshi
TILLE OF INVENTION: Nucleic Acids Encoding Zinc Metalloproteases
FILLE REFERENCE: 264734607/10-30-00
CURRENT APPLICATION NUMBER: US/09/369,364A

CURRENT FILING DATE: 1999-08-06
NUMBER OF SEQ ID NOS: 31

SOFTWARE: PatentIn Ver. 2.1

SEQ ID NO 7

LENGTH: 997

Novel gene cluster which is specifically expressed in tissue or organ during developmental phase of sea squirt, useful for elucidation of mechanism of development of tissue or organ of sea squirt.

Claim 1; SEQ ID NO 466; 1846pp; Japanese

This invention relates to novel genes and the encoded proteins thereof that are derived from the sea squirt Ciona intestinalis. Specifically, it refers to those genes that are expressed in the tissues or organs of the sea squirt during its developmental phase. The present invention describes the identification of these genes as useful for elucidation of the mechanism of development and hence for developing regeneration medicines and gene therapy techniques. Accordingly, they can be used in the research of various genetic diseases, as well as the analysis of cell proliferation, differentiation and reproduction. Furthermore, such compositions can be useful for senvironmental measurements and water surveys, particularly for sea water surveys, and also for the preparation of transformed sea squirt for improving edibility of sea squirt protein sequence that has tissue specific expression during development, given in

AAE04264 standard; peptide; 27 AA.

ö

```
The present sequence represents a peptide that stimulates neuronal (particularly axonal) sprouting in neurons of the cerebral cortex, and in spinal cord cells inhibits aggregation and defasiculation of neurites while increasing formation of synaptic contacts. The peptide is used to regenerate nervous system cells, particularly for treating neurodegeneration (e.g. Alzheimer's or Parkinson's diseases, multiple celevosis and myopathy), other conditions requiring regeneration (particularly elongation and synapse formation) or neuroblastoma. The peptide can also be used as an additive for neuronal cell cultures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptides for promoting growth of neurons - useful for treatment of neurodegeneration, neuroblastoma and as additives for neuronal cell
                                                                                                                                                                                                                                                                                                                               Neuronal sprouting; cerebral cortex; spinal cord cell; aggregation; neurite defasiculation; regeneration; nervous system cell; nerodegenration; Alzheimer's; Parkinson's disease; multiple sclerosis; myopathy; synapse formation; neuroblastoma.

AADOB488-AADOB529 represent cDNAs corresponding to 18 human secreted protein genes, and AAE04199-AAE04299 represent the proteins they encode. protein genes, and AAE04297 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating crow protein in a sample or by determining the amount of the pathological conditions can be diagnosed by determining the amount of the pathological conditions can be diagnosed by determining the amount of the converted in a sample or by determining the presence of mutations in new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, converted to the diagnosis or treatment of proliferative disorders (e.g., rheumatoid arthritis), inflammation, allergies, and include disorders (e.g., Alzhimer's disease, Parkinson's disease), cognitive disorders (e.g., Alzhimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders, cognitive disorders, schizophrenia, asthma, skin disorders, propagnic disorders, and also be used to aid wound healing and epithelial cell propagnic disorders, independent disorders, and infections. The propagnic tissues, to identify their cognate ligands or binding to reservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservation of the invention can be used as a food additive or preservation temperamental and be used in alleviating symptoms associated protein sequence represents and under above, and in diagnostic immunoassay or enzyme linked immunosorbent assay (ELISA). The radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The preserve in the historian and human secreted protein fragment referred to heaven to historian and human secreted protein fragment referred to heaven to historian and human secreted protein fragmenting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                        Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; inflammation, allergy; neurological disorder; Alzheimer's disease; parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosls; cardiovascular disorder; anglogenic disorder; kidney disorder; agastrointestinal disorder; pregnancy-related disorder; gene therapy; endocrine disorder; infection; wound healing; vulnerary; call culture; chemocraxis; food additive; binding partner identification; chromosome 7.
                                                                                                                               Human gene 8 encoded secreted protein fragment, SEQ ID NO:127.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Komatsoulis GA, Baker KP, Young PE;

AAD08488-AAD08529 represent cDNAs corresponding to 18 human secreted proteins genes, and AAE04199-AAB0423 represent the protein they encode. AAE04240-AAE04297 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the rissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative developing products for the diagnosis or treatment of proliferative disorders, tumours, foetal and developmental abnormalities, disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid archritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, disbetes, atheroselesis, cardiovascular disorders, angiogenic disorders, indorders, gastrointestinal disorders, angiogenic disorders, atheroselesis, cardiovascular disorders, propileration, to prevent skin ageing due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.

ö
to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay or enzyme linked immunosorbent assay (BLISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Xaa equals any of the naturally occurring L-amino acids"

AMENGAS29 represent cDNAB corresponding to 18 human secreted protein genes, and AAE04199-AAE04239 represent the proteins they encode.

Drotein genes, and AAE04199-AAE04239 represent the proteins they encode.

AAE04240-AAE04297 represent human secreted protein freagments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions. e.g., by protein or gene therapy.

CC reme protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, tumnours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune classactoric disorders, schizophrenia, asthma, skin disorders, e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., Alzheimer's disorders, candioders, schizophrenia, asthma, skin disorders, engingenic disorders, sidney disorders, gastrointestinal disorders, pregnancy-related disorders, atherosclerosis, cardiovascular disorders, propingent of disorders, and meaning and epithalial cell properties and in chemotaxis, and can be used as a food additive or preters, and in chemotaxis, and can be used as a food additive or preters, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a present sequence represents a human secreted protein fragment referred to redisorner of the invention
                                                                          Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                      Disclosure; Page 494-495; 509pp; English

AMD08488-AAD08529 represent cDNA8 corresponding to 18 human secreted protein genes, and AAE04199-AAE04239 represent the protein they encode. Drotein genes, and AAE04199-AAE04239 represent the protein fragments or variants. The secreted protein or gene they encode. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Cor ameliorating medical conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, cancer, tumours, foetal and developmental abnormalities, discaders, cancer, tumours, foetal and developmental abnormalities, cancer, transuction arthritis), inflammation, allergies, autoimmune conditive disorders (e.g., Alzahimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., Alzahimer's disease, Parkinson's disease), cognitive disorders, kidney disorders, atherosclerosis, cardiovascular disorders, angiogenic disorders, witherosclerosis, cardiovascular disorders, angiogenic disorders, witherosclerosis, cardiovascular disorders, preparancy-related disorders, atherosclerosis, cardiovascular disorders, proteins can also be used to and wound healing and epithelial cell colleration, to prevent skin againg due to sunburn, to maintain organs proliferation, to prevent skin againg due to sunburn, to maintain organs to reservative to modify storage properties Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a preservative to modify storage properties, and in diagnostic immunoassay or enzyme linked immunososy, and in diagnostic immuno

```
AABO08489-AAD08529 represent cDNAs corresponding to 18 human secreted protein genes, and AAE04199-AAE04239 represent the protein they encode. AAE04240-AAE04297 represent human secreted protein fragments or variants. CT he secreted protein preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. The secreted proteins can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, can on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders (e.g., Alzahimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., pregnancy-related disorders, and become disorders, and can disease, professions can also be used to aid wound healing and epithelial cell proliferation, to prevent skin ageing due to sunburn, to maintain organs before transplantation; for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding carriers, and in chemotaxis, and can be used as a food additive or protein of the invention can be used as a food additive or protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay or enzyme linked immunosociated protein fragment referred to repere the invention can be used in diagnostic immunoassay or enzyme linked immunosociated protein fragment referred to the historians.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                  Parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; angiogenic disorder; kidney disorder; gastrointestinal disorder; pregnancy-related disorder; gene therapy; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; binding partner identification; chromosome?
  Inflammation; allergy; neurological disorder; Alzheimer's disease;

Non-naturally occurring Type I repeat peptide (TRP) derived from human thrombospondin-1, KIAA0688 or KIAA0550 proteins, useful in the treatment of angiogenesis and/or cancer.

Claim 5; Fig 7; 84pp; English.

specification describes a non-naturally occurring Type I repeat peptide (TRP), derived from human thrombospondin-1 (hTSP-1), KIAA0688 or KIAA0550 proteins. The From human thrombospondin-1 (hTSP-1), KIAA0688 or KIAA0550 proteins. The protein is an angiogenesis inhibitory protein. TRP proteins are used for the treatment of conditions associated with angiogenesis and cancer. Angiogenic mediated diseases include tumours, rheumatoid arthritis, pasoriasis, ocular angiogenic diseases, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis), Osler Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, arteriovenous malformations, ischemic limb angiogenesis, neovascular glaucoma, retrollental fibroplasia, heliobacter related diseases, fractures, vasculogenesis, hamatopoicesis, ovulation, menstruation and placentation. TRPs are also useful in the treatment of disease of excessive or abnormal stimulation of endothelial cells. TRP can also be used as a birth control agent, as it prevents the vascularisation required for embryo implantation The present sequence represents a KIAA0550 polypeptide. The

This invention relates to multine and human ADAMTS-N (A disintegrin-like and metalloprotease domain with thrombospondin type I motifs) proteins, and metalloprotease domain with thrombospondin type I motifs) proteins, considerable and antibodies invention are cDNA sequences encoding the proteins, and antibodies invention are cords. The nucleic acid sequences and proteins may be specific for the proteins. The nucleic acid sequences and proteins may be using the nucleic acids, proteins and antibodies include, for example cusing the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos in arthritic (EDS-VIIC) in humans, erosion of articular cartilage or in arthritic (both inflammatory and non-inflammatory) disease, and siscontrolling embryogenesis and implantation of fertilised eggs. The controlling embryogenesis and implantation of fertilised eggs. The present sequence represents human ADAMTS-7. The human ADAMTS-7 gene is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mitochondrial; human; screening assay; diabetes mellitus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADJ69288
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABS57372-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these
                                                                                                                                                                                                                                                       identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    compositions have neuroprotective, nootropic, antidiabetic, anticonvolsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nootropic; antisickling; antianemic; antitumor; anti-HIV; antiallergic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to a novel isolated human extracellular matrix and cell adhesion molecule (referred to as ECMCAD 1-36), its biologically cell adhesion molecule (referred to as ECMCAD 1-36), its biologically cell adhesion molecule is useful for screening a compound for ECMCAD 1-36. The molecule is useful for screening a compound for effectiveness as agonist or antagonist of itself. The protein and its encoding nucleic acid are useful in the diagnosis, treatment and prevention of genetic disorder such as adrenoleukodystrophy, Down's prevention of genetic disorder such as adrenoleukodystrophy, Down's syndrome, athalassemia, Milms' tumor, etc., immunological disorders such as acquired immunodeficiency syndrome, etc., immunological disorders such as acquired immunodeficiency syndrome, atharosclerosis, autoimmune hemolytic anemia, achma, atharosclerosis, autoimmune hemolytic anemia, contact dermatitis, Goodpasture's syndrome, gout, Grave's adisease, multiple sclerosis, osteoporosis, poriasis, rheumatoid arthritis, scleroderma, systemic lugus erythematosus, ulcerative colitis, uveitis, etc, a neurological disorder such as epilepsy, stroke, Alzheimmer's disease, Huntington's disease, Parkinson's disease, multiple sclerosis, batterial and viral meningitis, periodic paralysis, mental disorders including mood, anxiety, and schizophrenic disorders, mental disorders including mood, anxiety, and acell proliferative disorder such as actinic keratosis, atherosclerosis, bepatitis, psoriasis, cancers uch as actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers including adenocarcinoma, leukemia, lymphoma, melanoma, myeloma, etc.
This sequence represents one of the novel proteins.

Novel mammalian G protein coupled receptors, useful for identifying compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.

Claim 1; SEQ ID NO 107; 542pp; English.

The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of the invention, methods of treating, preventing or diagnosing diseases associated with GPCRs of the invention, methods of screening for compounds useful in the treatment of GPCR-related diseases, a transgenic compounds useful in the treatment of GPCR-related diseases, a transgenic mouse comprising a GPCR gene of the invention; a mouse comprising a mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transmagner mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polynucleotides of the invention. The probes which hybridise to GPCR polynucleotides of the invention. The used in the diagnosis, treatment or prevention of a wide variety of the used in the diagnosis, treatment or prevention of a wide variety of diseases including neurobathy, Parkinson's disease or schizophrenia); disorders of the adrenal gland; disorders of the colon or intestine of syndrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or myocardial infarction); muscular disorders; blood disorders (e.g.,

```
AIDS); bone and joint disorders (e.g., osteoarthritis, rheumatoid arthritis, gout or osteoporosis); metabolic or nutritive disorders (e.g., obsestry, enzyme deficiency-related diseases or vitamin deficiency-related diseases); and disorders of the kidney, luver, lung, breast, ovary, uterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a GPCR of the invention. Note: The full sequence data for this patent did not form part of the printed specification; those sequences not shown were obtained in ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human BAI3 protein. The gene is expressed specifically in the brain and plays an important role in cancer formation in the brain. The BAI3 protein can be used in drug compositions to diagnose, prevent or treat such cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human BAI gene - is expressed in brain plays important role in cancer
